

Solarus Internet Services

15
YEARS

T1 Services

- Dedicated Internet access at 1.5 Mbps (Megabits per second download & upload).
- Allows multiple users to transmit information more securely than over a shared connection (ex: large files, higher capacity emails).
- Ideal for businesses that require a dedicated connection.
- With this business-class offering, you can expect fast response to trouble or outages.
- Extremely reliable speed that you can count on with less latency than broadband or cable modem connections.

DS3 Services (all benefits of T1 apply PLUS)

- Extremely reliable 45 Mbps X 45 Mbps dedicated connection.
- Readily-available and equivalent to 28 T1's.
- Due to capacity of DS3, multiple services can be configured to work over the connection such as voice or wide area networking connectivity.
- Very low latency.

Ethernet

- Most reliable and scalable connection, up to and greater than 10 Gig depending on the electronics.
- Multiple services such as voice, Internet, and wide area network can be layered over a Fiber connection, lowering your overall costs.
- Dynamic bandwidth allocation, meaning it's not necessary to dedicate capacity for one specific application. Instead the bandwidth can be shared for better efficiency.
- Very low latency.
